A SHORT HISTORY

The M4 Sherman was a culmination of over 20 years of U.S. Army research on perfecting tank design. This included later iterations such as the M4A2, A3, A4, and A6 variants. The modular design of the platform enabled easy modification and upgrading of components on the system. Because of this, the M4 saw over 50 different variants and a wide array of mission capabilities that far exceeded the original production intention. This included three different gun barrels on these models, with 75-mm, 76-mm, and 105-mm tubes being used. However, the 75-mm tube that the platform was designed for remained the most used.

The last Sherman tank was removed from service in 2018, when Paraguay removed them from their inventory. This ended a life of service of 78 years.
